

## Incident handler's journal

<b>Date:</b> 11/21/2025	<b>Entry:</b> #1
Description	Record documenting a security event affecting a healthcare organization.
Tool(s) used	No tools were necessary for producing this report.
The 5 W's	<ul style="list-style-type: none"><li>• <b>Who:</b> A coordinated team of malicious, unethical hackers.</li><li>• <b>What:</b> A ransomware-related security breach.</li><li>• <b>Where:</b> Within a company operating in the healthcare sector.</li><li>• <b>When:</b> Tuesday morning at around 9:00 a.m.</li><li>• <b>Why:</b> The attackers infiltrated the company's environment through a phishing message. Once inside, they executed ransomware that encrypted vital operational data. Their motive appears to be financial, as they left a ransom note demanding a substantial payment for the decryption key.</li></ul>
Additional notes	<ol style="list-style-type: none"><li>1. What preventive measures could the healthcare company implement to avoid similar attacks in the future?</li><li>2. Is paying the ransom a viable or advisable option for recovering the encrypted data?</li></ol>

<b>Date:</b> 11/22/2025	<b>Entry:</b> #2
Description	Analyzed network traffic in <i>sample.pcap</i> to inspect IPs, protocols, and DNS/TCP/ICMP packets.

Tool(s) used	Wireshark Windows VM (Qwiklabs)
The 5 W's	<ul style="list-style-type: none"> <li>• <b>Who:</b> A legitimate user generating normal web traffic.</li> <li>• <b>What:</b> Normal network communication occurred, including DNS queries, HTTP traffic, TCP sessions, and ICMP packets.</li> <li>• <b>Where:</b> Within the Windows VM environment.</li> <li>• <b>When:</b> During the timeframe captured in <i>sample.pcap</i>.</li> <li>• <b>Why:</b> To analyze web traffic and practice Wireshark filtering.</li> </ul>
Additional notes	Applied filters (DNS, TCP, ICMP, MAC). Confirmed DNS resolution for <a href="https://opensource.google.com">opensource.google.com</a> . No malicious activity observed.

<b>Date:</b> 11/23/2025	<b>Entry:</b> #3
Description	Investigated a malicious spreadsheet file received via email. Generated SHA256 hash and analyzed it using VirusTotal to identify IoCs.
Tool(s) used	VirusTotal
The 5 W's	<ul style="list-style-type: none"> <li>• <b>Who:</b> A threat actor distributing a malicious spreadsheet via email.</li> <li>• <b>What:</b> An employee downloaded and opened a password-protected spreadsheet containing a payload that executed malware on their computer. SOC received an alert from the IDS.</li> <li>• <b>Where:</b> On the employee's workstation within the corporate network.</li> <li>• <b>When:</b> Between 13:11 and 13:20, based on the email receipt, file execution, and IDS alert timeline.</li> </ul>

	<ul style="list-style-type: none"> <li>● <b>Why:</b> The employee opened a malicious file attached to a phishing email, executing malware.</li> </ul>
Additional notes	<ol style="list-style-type: none"> <li>1. VirusTotal confirmed the file as malicious.</li> <li>2. Identified IoCs: additional hashes, malicious IP, and domain contacts.</li> <li>3. Behavior observed in sandbox: unauthorized executable creation, registry/file modifications, and network connections.</li> </ol>

<b>Date:</b> 11/24/2025	<b>Entry:</b> #4
Description	Reviewed the organization's final incident report to understand the lifecycle of a major data breach affecting over one million users.
Tool(s) used	Final Incident Report (provided by the company) Internal SOC documentation
The 5 W's	<ul style="list-style-type: none"> <li>● <b>Who:</b> An external threat actor exploiting vulnerabilities in the company's e-commerce web application.</li> <li>● <b>What:</b> A major data breach occurred: attackers accessed and exfiltrated customer data by exploiting a web application flaw.</li> <li>● <b>Where:</b> Within the company's e-commerce platform and supporting infrastructure.</li> <li>● <b>When:</b> During the period outlined in the report's timeline section (exact times documented in the final report).</li> <li>● <b>Why:</b> Due to an unpatched vulnerability and insufficient security controls within the web application, allowing attackers to gain unauthorized access.</li> </ul>
Additional notes	Focused on understanding: <ol style="list-style-type: none"> <li>1. Root cause explained in the <i>Investigation</i> section</li> </ol>

	<ol style="list-style-type: none"> <li>2. Attack method used to exploit the web vulnerability</li> <li>3. Incident response actions listed in the <i>Timeline</i></li> <li>4. Future improvement recommendations such as access controls and routine vulnerability scans</li> </ol>

<b>Date:</b> 11/25/2025	<b>Entry:</b> #5
Description	Monitored network traffic using Suricata with custom rules; triggered alerts on simulated HTTP traffic and analyzed Suricata log outputs.
Tool(s) used	Suricata IDS/IPS sample.pcap file custom.rules file jq (for JSON log analysis)
The 5 W's	<ul style="list-style-type: none"> <li>• <b>Who:</b> N/A — simulated network traffic for lab exercise.</li> <li>• <b>What:</b> Custom Suricata rules triggered alerts on HTTP GET requests; alerts were recorded in fast.log and detailed in eve.json for analysis.</li> <li>• <b>Where:</b> On the lab virtual machine processing the sample.pcap file.</li> <li>• <b>When:</b> During lab activity session (simulated timeframe).</li> <li>• <b>Why:</b> The custom Suricata rule was configured to detect HTTP GET traffic from the home network to external IPs.</li> </ul>
Additional notes	<ol style="list-style-type: none"> <li>1. Alerts captured included <b>GET on wire</b> messages.</li> <li>2. fast.log provided a quick summary of triggered alerts; eve.json contained full JSON-formatted event data.</li> <li>3. jq tool enabled structured analysis of timestamps, flow IDs,</li> </ol>

	<p>protocols, alert messages, and destination IPs.</p> <p>4. Destination IPs observed in alerts included 142.250.1.139 and 142.250.1.102.</p>

<b>Date:</b> 11/26/2025	<b>Entry:</b> #6
Description	Phishing incident involving potential malware download.
Tool(s) used	No tools were necessary for producing this report.
The 5 W's	<ul style="list-style-type: none"> <li>• <b>Who:</b> Unethical hacker (sender: Def Communications &lt;76tguyhh6tgfrt7tg.su&gt;)</li> <li>• <b>What:</b> Phishing email attempting to trick the recipient into downloading malware (<b>bfsvc.exe</b>)</li> <li>• <b>Where:</b> Financial services company (Inergy)</li> <li>• <b>When:</b> Tuesday morning around 09:30 AM</li> <li>• <b>Why:</b> Employee opened a malicious email attachment protected by a password (<b>paradise10789</b>). The email contained multiple spelling errors and inconsistencies, indicating a phishing attempt.</li> </ul>
Additional notes	<p>The attached file hash  <b>54e6ea47eb04634d3e87fd7787e2136ccfbcc80ade34f246a12cf93bab527f6b</b> is known to be malicious.</p> <p>The phishing email exploited social engineering by pretending to be a job applicant.</p> <p><b>Preventive measures / Recommendations:</b></p> <ol style="list-style-type: none"> <li>1. Conduct regular security awareness training for employees to recognize phishing emails.</li> </ol>

	2. Implement email filtering solutions to block suspicious attachments and domains.
